Dreifing / Distribution: Pósthólf 5128 / P.O. Box 5128, IS-125 Reykjavík

Forsíðumynd / *Cover figure*: Gengissigið Í Kverkfjöllum í lok hlaups þann 16. ágúst. Þétt dreif af uppbrotnum lagnaðarís þekur botn sigsins og glöggst má sjá hvar vatnsborðið var fyrir hlaupið, í 1638 m y.s. Dökkar dreifar af leir frá gufuspreningum ná um 1 km norður fyrir sigið. Frásögn af þessum atburði er á bls. 149. – *On August 15th, a small jökulhlaup from Kverkfjöll occurred as a result of a sudden drainage of an ice-dammed lake. Kverkfjöll is a central volcano at the northern edge of Vatnajökull, with an active geothermal area. Phreatic steam explosions at the bottom of the drained lake generated small fans of ejecta, reaching ~1 km northwards, see also p. 149–151. Ljósmynd. Björn Oddsson.*
